DETAILED ACTION

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

3. Claims 1 and 3 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gawa et al. in U.S. Patent No. 6,090,330 in view of Brown et al. in U.S. patent No. 3,698,797. Gawa et al. discloses a laser system (element 21) for producing an output beam, and target delivery optics (elements 28x,28y) to deliver the output beam to a target workpiece. Brown et al. teaches a laser attenuator with a relay telescope (using lenses 21,15) and a baffle (the second element 12 in figure 1) at the telescope focal point that is large enough to easily pass the output beam propagating to the target (since Brown et al. uses the later pinhole (element 13) to filter the light) and is small enough to block off angle and out of focus back reflections from the target delivery

optics since the baffle absorbs energy of off angle reflections from the pinhole. It would have been obvious to adapt Gawa et al. in view of Brown to provide this to attenuate the power of the laser beam before it reaches the target workpiece. Regarding claim 3, the baffle is considered to be shaped like a large pinhole or alternatively can be considered a pinhole baffle since it is associated with a pinhole (element 13).

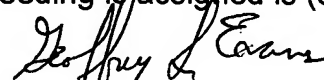

4. Applicant's arguments with respect to claims of record have been considered but are moot in view of the new ground(s) of rejection.

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Benjamin et al. in U.S. Patent No. 4,194,813 discloses a vacuum chamber with a disc having an aperture. Back reflections in Benjamin et al. are prevented from reaching the laser by having the edge of the focused beam impinge on the edge of the aperture to produce plasma. Miyagawa in U.S. patent No. 4,832,446 has a spatial filter.
